## Power Tools for Tableau Deployment

## Automate & Scale Tableau Server Deployments

**Power Tools for Tableau: Deployment** enables the governance of Tableau Server workbook and data source migrations. Admins and technology groups can finally automate and scale the distribution of workbooks/data sources between development, staging and production environments.

Beyond the standard promotion that takes place between server environments, you can make copies of template workbooks and change out the data source(s) for a bunch of different clients. Our Deployment tool is ideal for analytics teams and enterprise organizations.

Need to do a large, one-time migration of workbooks and/or data sources instead? You can quickly set that up, as well. Read on to see all the convenient features at your disposal:

- + Reduce the average time of large Tableau workbook/data source deployments from hours to minutes
- + Remove the potential for errors in deployment by automating the steps in the process
- + Easily configure data source changes and permissions
- + Archive deployments and rollback to a prior version if necessary
- + Incorporate quality checks and watermarking into your ongoing process
- + Save documentation for all deployments and quickly audit warnings/ errors if necessary
- + Apply customer-specific edits to dashboards through configuring of transformations
